

E2 PRO

In pursuit of the excellent blend of cost performance and quality product properties, we have launched a new portable color Doppler ultrasound system, the E2 PRO. A streamlined system to make your work experience easier than any other entry-level system, the E2 PRO is packed with complete standard ultrasound functions and a full library probes for different applications.

Wide-Scan

With wide-scan, the ultrasound image can be enlarged when performing a real time scan when using linear or convex probes, for a larger, more complete view of large lesions.

Vis-Needle

Vis-Needle is realized by ultrasound beam steering and deflection. It improves visualization of the needle location in the tissue to minimize harm to the surrounding tissue, increasing the initial success rate and lowering the risk for needle puncture.

Panoramic Imaging

With real-time panoramic, you can acquire an extended field of view for large organ or long vessel for easy measurement and diagnostic efficiency.

Screen Zoom

Screen zoom on E2 PRO enables the user to zoom in on the ultrasound image without fear of signal loss and gives a high resolution, zoomed in image so it is easier to see small details for a confident diagnosis and increased workflow.

Value and Quality
